Meal - Want a meal

By Cindy (Xin) Wen, March 2017

Category:
Food & Drink

Description:
This app is used for customers of some restaurant to check menu, make reservations, check restaurant's location and direction, log into account or register a new account.

In the "Menu" view, a collection of dishes is provided with name, price and image. Customers can check the dishes the restaurant have and make a decision if they want to go for a meal or not.

In the "Reservation" view, customers can pick a date, number of people, leave the phone number and preferred name to make a reservation.

In the "Location" view, the location of the restaurant is shown as a pin. Address and phone number are shown both above the map and when the pin is tapped. When "direction" button is pressed, the app will fetch user's current location and displays a shortest route from the current location to the restaurant.

"Account" view provides function for logging in and registering. Users can log in and log out for their convenience. For new users, a registration view is provided by tapping "Register". Once a new account is registered, the user is sent back to the log in view and can log in then. If the user already has an account, press "I have an account, go back to log in". There is an info button beside the login button, press it once, an instruction for the app displays, press it again, the instruction will dismiss.

All requests like getting the direction, making reservations, logging in and registering are sent to a database server. In order to process the requests, Internet connection is needed, otherwise, an alert will show up.

Keywords:
Restaurant, Food, Menu, Reservation, Direction, Account, Register, Log in.
